

## Summary

The Xilinx<sup>®</sup> Zynq<sup>®</sup> UltraScale+<sup>™</sup> MPSoCs are available in -3, -2, -1 speed grades, with -3E devices having the highest performance. The -2LE and -1LI devices can operate at a  $V_{CCINT}$  voltage at 0.85V or 0.72V and are screened for lower maximum static power. When operated at  $V_{CCINT} = 0.85V$ , using -2LE and -1LI devices, the speed specification for the L devices is the same as the -2I or -1I speed grades. When operated at  $V_{CCINT} = 0.72V$ , the -2LE and -1LI performance and static and dynamic power is reduced.

DC and AC characteristics are specified in extended (E), industrial (I), automotive (Q), and military (M) temperature ranges. Except the operating temperature range or unless otherwise noted, all the DC and AC electrical parameters are the same for a particular speed grade (that is, the timing characteristics of a -1 speed grade extended device are the same as for a -1 speed grade industrial device). However, only selected speed grades and/or devices are available in each temperature range.

The XQ references in this data sheet are specific to the devices available in XQ Ruggedized packages. See the *Defense-Grade UltraScale Architecture Data Sheet: Overview* (DS895) for further information on XQ Defense-grade part numbers, packages, and ordering information.

All supply voltage and junction temperature specifications are representative of worst-case conditions. The parameters included are common to popular designs and typical applications.

This data sheet, part of an overall set of documentation on the Zynq UltraScale+ MPSoCs, is available on the Xilinx website at [www.xilinx.com/documentation](http://www.xilinx.com/documentation).

Xilinx is creating an environment where employees, customers, and partners feel welcome and included. To that end, we're removing non-inclusive language from our products and related collateral. We've launched an internal initiative to remove language that could exclude people or reinforce historical biases, including terms embedded in our software and IPs. You may still find examples of non-inclusive language in our older products as we work to make these changes and align with evolving industry standards. Follow this [link](#) for more information.

**Notes:**

- All voltages are relative to GND, assuming supplies are present.
- For the design of the power distribution system consult the *UltraScale Architecture PCB Design User Guide* (UG583).
- $V_{CC\_PSINTFP\_DDR}$  must be tied to  $V_{CC\_PSINTFP}$ .
- Each voltage listed requires filtering as described in the *UltraScale Architecture PCB Design User Guide* (UG583).
- Includes  $V_{CCO\_PSDDR}$  of 1.2V, 1.35V, 1.5V at  $\pm 5\%$  and 1.1V  $+0.07V/-0.04V$  depending upon the tolerances required by specific memory standards.
- Applies to all PS I/O supply banks. Includes  $V_{CCO\_PSIO}$  of 1.8V, 2.5V, and 3.3V at  $\pm 5\%$ .
- Up to 1.89V is acceptable on  $V_{CC\_PSBATT}$ . If the battery-backed RAM or RTC is not used, connect  $V_{CC\_PSBATT}$  to GND or  $V_{CC\_PSAUX}$ .
- $V_{CCINT\_IO}$  must be connected to  $V_{CCBRAM}$ .
- Includes  $V_{CCO}$  of 1.0V (HP I/O only), 1.2V, 1.35V, 1.5V, 1.8V, 2.5V (HD I/O only) at  $\pm 5\%$ , and 3.3V (HD I/O only) at  $+3/-5\%$ .
- $V_{CCAUX\_IO}$  must be connected to  $V_{CCAUX}$ .
- The lower absolute voltage specification always applies.
- A total of 200 mA per bank should not be exceeded.
- Each voltage listed requires filtering as described in the *UltraScale Architecture GTH Transceivers User Guide* (UG576) or the *UltraScale Architecture GTY Transceivers User Guide* (UG578).
- Xilinx recommends measuring the  $T_J$  of a device using the system monitor as described in the *UltraScale Architecture System Monitor User Guide* (UG580). The SYSMON temperature measurement errors (that are described in Table 69 and Table 126) must be accounted for in your design. For example, when using the PL system monitor with an external reference of 1.25V, and when SYSMON reports 97°C, there is a measurement error  $\pm 3^\circ\text{C}$ . A reading of 97°C is considered the maximum adjusted  $T_J$  ( $100^\circ\text{C} - 3^\circ\text{C} = 97^\circ\text{C}$ ).
- Devices labeled with the speed/temperature grade of -2LE can operate for a limited time at a junction temperature between 100°C and 110°C. Timing parameters adhere to the same speed file at 110°C as they do below 110°C, regardless of operating voltage (nominal voltage of 0.85V or a low-voltage of 0.72V). Operation up to  $T_J = 110^\circ\text{C}$  is limited to 1% of the device lifetime and can occur sequentially or at regular intervals as long as the total time does not exceed 1% of the device lifetime.

<b>Uncalibrated programmable on-die termination in HD I/O banks (measured per JEDEC specification)</b>					
R <sup>9</sup>	Thevenin equivalent resistance of programmable input termination to V <sub>CCO</sub> /2 where ODT = RTT_48	-50%	48	+50%	Ω

**Notes:**

- Typical values are specified at nominal voltage, 25°C.
- For the HP I/O banks with a V<sub>CCO</sub> of 1.8V and separated V<sub>CCO</sub> and V<sub>CCAUX\_IO</sub> power supplies, the I<sub>L</sub> maximum current is 70 μA.
- This measurement represents the die capacitance at the pad, not including the package.
- Maximum value specified for worst case process at 25°C.
- I<sub>CC\_PSBATT</sub> is measured when the battery-backed RAM (BBRAM) is enabled.
- Do not program eFUSE during device configuration (e.g., during configuration, during configuration readback, or when readback CRC is active).
- VRP resistor tolerance is (240Ω ±1%).
- If VRP resides at a different bank (DCI cascade), the range increases to ±15%.
- On-die input termination resistance, for more information see the *UltraScale Architecture SelectIO Resources User Guide* (UG571).

**Notes:**

- Typical values are specified at nominal voltage, 85°C junction temperatures (T<sub>j</sub>) with single-ended SelectIO™ resources.
- Typical values are for blank configured devices with no output current loads, no active input pull-up resistors, and all I/O pins are 3-state and floating.
- Use the Xilinx® Power Estimator (XPE) spreadsheet tool (download at [www.xilinx.com/power](http://www.xilinx.com/power)) to estimate static power consumption for conditions or supplies other than those specified.
- Typical values depend upon your configuration. To accurately estimate all PS supply currents, use the interactive XPE spreadsheet tool.

## Power Supply Sequencing

### PS Power-On/Off Power Supply Sequencing

The low-power domain (LPD) must operate before the full-power domain (FPD) can function. The low-power and full-power domains can be powered simultaneously. The PS\_POR\_B input must be asserted to GND during the power-on sequence (see Table 37). The FPD (when used) must be powered before PS\_POR\_B is released.

To achieve minimum current draw and ensure that the I/Os are 3-stated at power-on, the recommended power-on sequence for the low-power domain (LPD) is listed. The recommended power-off sequence is the reverse of the power-on sequence.

1.  $V_{CC\_PSINTLP}$
2.  $V_{CC\_PSAUX}$ ,  $V_{CC\_PSADC}$ , and  $V_{CC\_PSPLL}$  in any order or simultaneously.
3.  $V_{CCO\_PSIO}$

To achieve minimum current draw and ensure that the I/Os are 3-stated at power-on, the recommended power-on sequence for the full-power domain (FPD) is listed. The recommended power-off sequence is the reverse of the power-on sequence.

1.  $V_{CC\_PSINTFP}$  and  $V_{CC\_PSINTFP\_DDR}$  driven from the same supply source.
2.  $V_{PS\_MGTRAVCC}$  and  $V_{CC\_PSDDR\_PLL}$  in any order or simultaneously.
3.  $V_{PS\_MGTRAVTT}$  and  $V_{CCO\_PSDDR}$  in any order or simultaneously.

## PL Power-On/Off Power Supply Sequencing

The recommended power-on sequence is  $V_{CCINT}$ ,  $V_{CCINT\_IO}/V_{CCBRAM}/V_{CCINT\_VCU}$ ,  $V_{CCAUX}/V_{CCAUX\_IO}$ , and  $V_{CCO}$  to achieve minimum current draw and ensure that the I/Os are 3-stated at power-on. The recommended power-off sequence is the reverse of the power-on sequence. If  $V_{CCINT}$  and  $V_{CCINT\_IO}/V_{CCBRAM}$  have the same recommended voltage levels, they can be powered by the same supply and ramped simultaneously.  $V_{CCINT\_IO}$  must be connected to  $V_{CCBRAM}$ . If  $V_{CCAUX}/V_{CCAUX\_IO}$  and  $V_{CCO}$  have the same recommended voltage levels, they can be powered by the same supply and ramped simultaneously.  $V_{CCAUX}$  and  $V_{CCAUX\_IO}$  must be connected together.  $V_{CCADC}$  and  $V_{REF}$  can be powered at any time and have no power-up sequencing requirements.

The recommended power-on sequence to achieve minimum current draw for the GTH or GTY transceivers is  $V_{CCINT}$ ,  $V_{MGTAVCC}$ ,  $V_{MGTAVTT}$  OR  $V_{MGTAVCC}$ ,  $V_{CCINT}$ ,  $V_{MGTAVTT}$ . There is no recommended sequencing for  $V_{MGTVCCAUX}$ . Both  $V_{MGTAVCC}$  and  $V_{CCINT}$  can be ramped simultaneously. The recommended power-off sequence is the reverse of the power-on sequence to achieve minimum current draw. If these recommended sequences are not met, current drawn from  $V_{MGTAVTT}$  can be higher than specifications during power-up and power-down.

## PS-PL Power Sequencing

The PS and PL power supplies are fully independent. All PS power supplies can be powered before or after any PL power supplies. The PS and PL power regions are isolated to prevent damage.

## Power Supply Requirements

Table 10 shows the minimum current, in addition to  $I_{CCQ}$  maximum, required by each Zynq UltraScale+ MPSoC for proper power-on and configuration. If these current minimums are met, the device powers on after all supplies have passed through their power-on reset threshold voltages. The device must not be configured until after  $V_{CCINT}$  is applied. Once initialized and configured, use the Xilinx Power Estimator (XPE) tools to estimate current drain on these supplies. The XPE spreadsheet tool (download at <https://www.xilinx.com/power>) is also used to estimate power-on current for all supplies.

## DC Input and Output Levels

Values for  $V_{IL}$  and  $V_{IH}$  are recommended input voltages. Values for  $I_{OL}$  and  $I_{OH}$  are guaranteed over the recommended operating conditions at the  $V_{OL}$  and  $V_{OH}$  test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at a minimum  $V_{CCO}$  with the respective  $V_{OL}$  and  $V_{OH}$  voltage levels shown. Other standards are sample tested.

## LVDS DC Specifications (LVDS\_25)

The LVDS\_25 standard is available in the HD I/O banks. See the *UltraScale Architecture SelectIO Resources User Guide* (UG571) for more information.

Table 23: LVDS\_25 DC Specifications

Symbol	DC Parameter	Min	Typ	Max	Units
$V_{CCO}^1$	Supply voltage	2.375	2.500	2.625	V
$V_{IDIFF}$	Differential input voltage: (Q - $\bar{Q}$ ), Q = High ( $\bar{Q}$ - Q), $\bar{Q}$ = High	100	350	600 <sup>2</sup>	mV
$V_{ICM}$	Input common-mode voltage	0.300	1.200	1.425	V

**Notes:**

1. LVDS\_25 in HD I/O banks supports inputs only. LVDS\_25 inputs without internal termination have no  $V_{CCO}$  requirements. Any  $V_{CCO}$  can be chosen as long as the input voltage levels do not violate the *Recommended Operating Condition* (Table 2) specification for the  $V_{IN}$  I/O pin voltage.
2. Maximum  $V_{IDIFF}$  value is specified for the maximum  $V_{ICM}$  specification. With a lower  $V_{ICM}$ , a higher  $V_{DIFF}$  is tolerated only when the recommended operating conditions and overshoot/undershoot  $V_{IN}$  specifications are maintained.

## LVDS DC Specifications (LVDS)

The LVDS standard is available in the HP I/O banks. See the *UltraScale Architecture SelectIO Resources User Guide* (UG571) for more information.

Table 24: LVDS DC Specifications

Symbol	DC Parameter	Conditions	Min	Typ	Max	Units
$V_{CCO}^1$	Supply voltage		1.710	1.800	1.890	V
$V_{ODIFF}^2$	Differential output voltage: (Q - $\bar{Q}$ ), Q = High ( $\bar{Q}$ - Q), $\bar{Q}$ = High	$R_T = 100\Omega$ across Q and $\bar{Q}$ signals	247	350	454	mV
$V_{OCM}^2$	Output common-mode voltage	$R_T = 100\Omega$ across Q and $\bar{Q}$ signals	1.000	1.250	1.425	V
$V_{IDIFF}^3$	Differential input voltage: (Q - $\bar{Q}$ ), Q = High ( $\bar{Q}$ - Q), $\bar{Q}$ = High		100	350	600 <sup>3</sup>	mV
$V_{ICM\_DC}^4$	Input common-mode voltage (DC coupling)		0.300	1.200	1.425	V
$V_{ICM\_AC}^5$	Input common-mode voltage (AC coupling)		0.600	–	1.100	V

**Notes:**

1. In HP I/O banks, when LVDS is used with input-only functionality, it can be placed in a bank where the  $V_{CCO}$  levels are different from the specified level only if internal differential termination is not used. In this scenario,  $V_{CCO}$  must be chosen to ensure the input pin voltage levels do not violate the *Recommended Operating Condition* (Table 2) specification for the  $V_{IN}$  I/O pin voltage.
2.  $V_{OCM}$  and  $V_{ODIFF}$  values are for LVDS\_PRE\_EMPHASIS = FALSE.
3. Maximum  $V_{IDIFF}$  value is specified for the maximum  $V_{ICM}$  specification. With a lower  $V_{ICM}$ , a higher  $V_{DIFF}$  is tolerated only when the recommended operating conditions and overshoot/undershoot  $V_{IN}$  specifications are maintained.
4. Input common mode voltage for DC coupled configurations. EQUALIZATION = EQ\_NONE (Default).
5. External input common mode voltage specification for AC coupled configurations. EQUALIZATION = EQ\_LEVEL0, EQ\_LEVEL1, EQ\_LEVEL2, EQ\_LEVEL3, EQ\_LEVEL4.

# AC Switching Characteristics

All values represented in this data sheet are based on the speed specifications in the Vivado® Design Suite as outlined in the following table.

**Table 25: Speed Specification Version By Device**

2021.2.1	Device
1.29	XCZU1CG, XCZU1EG, XCZU2CG, XCZU2EG, XCZU3CG, XCZU3EG, XCZU4CG, XCZU4EG, XCZU4EV, XCZU5CG, XCZU5EG, XCZU5EV, XCZU6CG, XCZU6EG, XCZU7CG, XCZU7EG, XCZU7EV, XCZU9CG, XCZU9EG, XCZU11EG, XCZU15EG, XCZU17EG, XCZU19EG XQZU3EG, XQZU5EV, XQZU7EV, XQZU9EG, XQZU11EG, XQZU15EG, XQZU19EG

Switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

- **Advance Product Specification:** These specifications are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.
- **Preliminary Product Specification:** These specifications are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.
- **Product Specification:** These specifications are released once enough production silicon of a particular device family member has been characterized to provide full correlation between specifications and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to production before faster speed grades.

## Testing of AC Switching Characteristics

Internal timing parameters are derived from measuring internal test patterns. All AC switching characteristics are representative of worst-case supply voltage and junction temperature conditions.

For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer and back-annotate to the simulation net list. Unless otherwise noted, values apply to all Zynq UltraScale+ MPSoCs.

## Speed Grade Designations

Because individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device. [Table 26](#) correlates the current status of the Zynq UltraScale+ MPSoC on a per speed grade basis. See [Table 3](#) for operating voltages listed by speed grade.

## Production Silicon and Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases.

Table 27 lists the production released Zynq UltraScale+ MPSoC, speed grade, and the minimum corresponding supported speed specification version and Vivado software revisions. The Vivado software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

**Notes:**

1. Dual in-line memory module (DIMM) includes RDIMM, SODIMM, and UDIMM.
2. Includes: 1 rank 1 slot, dual-die package 2 rank.
3. Includes: 2 rank 1 slot.
4. The JEDEC JESD79-4B standard for DDR4 SDRAM limits the maximum  $t_{CK}$  to 1.6 ns. Because of this limitation, Xilinx recommends working with your DRAM vendor to verify support for data rates at or less than 1066 Mb/s.
5. LPDDR4 support is only available as a 32-bit interface. Byte-mode LPDDR4 devices are not supported.
6. LPDDR4 single die package with ECC is limited to the performance specified for the LPDDR4 dual die package.
7. In SBVA484, SFVA625, UBVA494, and UBVA530 packages, DDR4 support is only available as a 32-bit or 16-bit interface and other memory support is available only as a 32-bit interface.
8. 64-bit LPDDR3 interface performance values are defined without ECC support.
9. LPDDR3 quad die package devices are not supported.

# Programmable Logic (PL) Performance Characteristics

This section provides the performance characteristics of some common functions and designs implemented in the Zynq UltraScale+ MPSoCs. These values are subject to the same guidelines as the [AC Switching Characteristics](#) section.

In each of the following LVDS performance tables, the I/O bank type is either high performance (HP) or high density (HD).

In LVDS component mode:

- For the input/output registers in HP I/O banks, the Vivado tools limit clock frequencies to 312.9 MHz for all speed grades.
- For IDDR in HP I/O banks, Vivado tools limit clock frequencies to 625.0 MHz for all speed grades.
- For ODDR in HP I/O banks, Vivado tools limit clock frequencies to 625.0 MHz for all speed grades.

**Notes:**

1. Native mode is supported through the [High-Speed SelectIO Interface Wizard](#) available with the Vivado Design Suite. The performance values assume a source-synchronous interface.
2. PLL settings can restrict the minimum allowable data rate. For example, when using the PLL with CLKOUTPHY\_MODE = VCO\_HALF the minimum frequency is PLL\_F<sub>VCOMIN</sub>/2.
3. In the SBVA484, SFRA484, UBVA494, and UBVA530 packages, the maximum data rate is 1260 Mb/s for DDR interfaces and 630 Mb/s for SDR interfaces.
4. LVDS receivers are typically bounded with certain applications to achieve maximum performance. Package skews are not included and should be removed through PCB routing.
5. Asynchronous receiver performance is limited to 1300 Mb/s for -3/-2 speed grades and to 1250 Mb/s for -1 speed grades.

# Programmable Logic (PL) Switching Characteristics

The following IOB high-density (HD) and IOB high-performance (HP) tables summarize the values of standard-specific data input delay adjustments, output delays terminating at pads (based on standard) and 3-state delays.

- $T_{\text{INBUF\_DELAY\_PAD\_I}}$  is the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.
- $T_{\text{OUTBUF\_DELAY\_O\_PAD}}$  is the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.
- $T_{\text{OUTBUF\_DELAY\_TD\_PAD}}$  is the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer. In HP I/O banks, the internal DCI termination turn-on time is always faster than  $T_{\text{OUTBUF\_DELAY\_TD\_PAD}}$  when the DCITERMDISABLE pin is used. In HD I/O banks, the on-die termination turn-on time is always faster than  $T_{\text{OUTBUF\_DELAY\_TD\_PAD}}$  when the INTERMDISABLE pin is used.

## IOB 3-state Output Switching Characteristics

Table 77 specifies the values of T<sub>OUTBUF\_DELAY\_TE\_PAD</sub> and T<sub>INBUF\_DELAY\_IBUFDIS\_O</sub>.

- T<sub>OUTBUF\_DELAY\_TE\_PAD</sub> is the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state).
- T<sub>INBUF\_DELAY\_IBUFDIS\_O</sub> is the IOB delay from IBUFDISABLE to O output.
- In HP I/O banks, the internal DCI termination turn-off time is always faster than T<sub>OUTBUF\_DELAY\_TE\_PAD</sub> when the DCITERMDISABLE pin is used.
- In HD I/O banks, the internal IN\_TERM termination turn-off time is always faster than T<sub>OUTBUF\_DELAY\_TE\_PAD</sub> when the INTERMDISABLE pin is used.

**Notes:**

1. The input delay measurement methodology parameters for LVDCI/HSLVDCI are the same for LVCMOS standards of the same voltage. Parameters for all other DCI standards are the same for the corresponding non-DCI standards.
2. Input waveform switches between  $V_L$  and  $V_H$ .
3. Measurements are made at typical, minimum, and maximum  $V_{REF}$  values. Reported delays reflect worst case of these measurements.  $V_{REF}$  values listed are typical.
4. Input voltage level from which measurement starts.
5. This is an input voltage reference that bears no relation to the  $V_{REF}/V_{MEAS}$  parameters found in IBIS models and/or noted in Figure 1.
6. The value given is the differential input voltage.

## Output Delay Measurement Methodology

Output delays are measured with short output traces. Standard termination was used for all testing. The propagation delay of the trace is characterized separately and subtracted from the final measurement, and is therefore not included in the generalized test setups shown in Figure 1 and Figure 2.

Figure 1: Single-Ended Test Setup

X16654-072117

Figure 2: Differential Test Setup

Parameters  $V_{REF}$ ,  $R_{REF}$ ,  $C_{REF}$ , and  $V_{MEAS}$  fully describe the test conditions for each I/O standard. The most accurate prediction of propagation delay in any given application can be obtained through IBIS simulation, using this method:

1. Simulate the output driver of choice into the generalized test setup using values from [Table 79](#).
2. Record the time to  $V_{MEAS}$ .
3. Simulate the output driver of choice into the actual PCB trace and load using the appropriate IBIS model or capacitance value to represent the load.
4. Record the time to  $V_{MEAS}$ .
5. Compare the results of step 2 and step 4. The increase or decrease in delay yields the actual propagation delay of the PCB trace.

## Device Pin-to-Pin Input Parameter Guidelines

The pin-to-pin numbers in the following tables are based on the clock root placement in the center of the device. The actual pin-to-pin values will vary if the root placement selected is different. Consult the Vivado Design Suite timing report for the actual pin-to-pin values.

Hold time is measured relative to the global clock input signal using the fastest process, fastest temperature, and fastest voltage.
2. This table lists representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible I/O and CLB flip-flops are clocked by the global clock net.
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.

**Notes:**

- This parameter indicates the total sampling error of the Zynq UltraScale+ MPSoC DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the MMCM to capture the DDR input registers' edges of operation. These measurements include: CLK0 MMCM jitter, MMCM accuracy (phase offset), and MMCM phase shift resolution. These measurements do not include package or clock tree skew.
- This parameter is the receive sampling error for RX\_BITSLICE when using dynamic phase alignment.
- This parameter is the receive sampling error for RX\_BITSLICE when using built-in self-calibration (BISC).

T <sub>CAL_ERROR</sub> <sup>2</sup>	24					ps

**Notes:**

1. Input\_logic\_uncertainty accounts for the setup/hold and any pattern dependent jitter for the input logic (input register, IDDRE1, or ISERDESE3).
2. Calibration error associated with quantization effects based on the IDELAY resolution. Calibration must be performed for each input pin to ensure optimal performance.

- Clocking must be implemented as described in the *UltraScale Architecture GTY Transceivers User Guide* (UG578).
- For speed grades -3E, -2E, and -2I, a 16-bit and 20-bit internal data path can only be used for line rates less than 8.1875 Gb/s.
- For speed grade -2LE, a 16-bit and 20-bit internal data path can only be used for line rates less than 8.1875 Gb/s when V<sub>CCINT</sub> = 0.85V or 6.25 Gb/s when V<sub>CCINT</sub> = 0.72V.
- For speed grades -1E, -1I, -1Q, and -1M, a 16-bit and 20-bit internal data path can only be used for line rates less than 6.25 Gb/s.
- For speed grade -1LI, a 16-bit and 20-bit internal data path can only be used for line rates less than 6.25 Gb/s when V<sub>CCINT</sub> = 0.85V or 5.15625 Gb/s when V<sub>CCINT</sub> = 0.72V.
- For the speed grades -1E, -1I, -1Q, and -1M, only a 64- or 80-bit internal data path can be used for line rates above 12.5 Gb/s.
- When the gearbox is used, these maximums refer to the XCLK. For more information, see the Valid Data Width Combinations for TX Asynchronous Gearbox table in the *UltraScale Architecture GTY Transceivers User Guide* (UG578).

		Ground $V_{REFP}$ pin to AGND, $T_j = -55^{\circ}\text{C}$ to $125^{\circ}\text{C}$	1.225	1.25	1.275	V

**Notes:**

- ADC offset errors are removed by enabling the ADC automatic offset calibration feature. The values are specified for when this feature is enabled.
- See the Analog Input section in the *UltraScale Architecture System Monitor User Guide* (UG580).
- When reading temperature values directly from the PMBus interface, the SYSMON has a  $+4^{\circ}\text{C}$  offset due to the transfer function used by the PMBus application. For example, the external REF temperature sensor error's range of  $\pm 3^{\circ}\text{C}$  becomes  $+1^{\circ}\text{C}$  to  $+7^{\circ}\text{C}$  when the temperature is read through the PMBus interface.
- Supply sensor offset and gain errors are removed by enabling the automatic offset and gain calibration feature. The values are specified for when this feature is enabled.
- See the Adjusting the Acquisition Settling Time section in the *UltraScale Architecture System Monitor User Guide* (UG580).
- Any variation in the reference voltage from the nominal  $V_{REFP} = 1.25\text{V}$  and  $V_{REFN} = 0\text{V}$  will result in a deviation from the ideal transfer function. This also impacts the accuracy of the internal sensor measurements (i.e., temperature and power supply). However, for external ratiometric type applications allowing reference to vary by  $\pm 4\%$  is permitted.
